

# October is Breast Cancer Awareness Month

Isn't it time YOU told all your friends and loved ones about  
*AmazinGrape!*

Really! Pink ribbons are everywhere and everyone believes there is an elusive cure out there somewhere. People with good intentions are raising millions for research, but are we any closer to finding the answer to this dreaded killer? Ever think it could already be here?

We are on a mission to tell people the truth about  
Breast Cancer and tell them there is something really great  
they can share with everyone right now!

Researchers already know,  
But they **WON'T** tell you about **APOPTOSIS!**

What? Look it up. Apoptosis is the body's **NATURAL** and normal physiological process of eliminating DNA damaged or mutated cells. (cancerous cells)

The purpose of chemotherapy for many years has been to try to cut off the oxygen to damaged or cancerous cells and cause the natural process of Apoptosis. However, chemotherapy kills a lot of good cells around the cancerous ones. Researchers at a Major University Hospital explain there are three types of Breast Cancer. The first (Estrogen receptor positive) can be helped with drugs and chemotherapy part of the time. The second (HER-2 over expressing) is much more aggressive but can be helped with drugs, chemotherapy, radiation, and surgery part of the time. The third (Triple-Negative) has no protocol. Doctors do everything possible but they know most patients won't make it. **Triple Negative is what kills 200,000 women annually.** When Researchers put Muscadine Extract on all three types of Breast Cancer (In-Vitro) **Apoptosis occurred naturally.** After seven days the level of inhibition was over 92% in ALL THREE TYPES of breast cancer, and the Muscadine only nourished the cells around the cancerous cells. This was so exciting the researcher said this should be marketed as a Chemo-Preventative Supplement. With this type of research results...

...wouldn't you want all your loved ones to be taking *AmazinGrape* everyday?
